

data + web DS tool

- Summary -

This database will be used a resource for both casual DJ's professional DJ's and dancers who like to hear good West Coast Swing music. The database will contain track information (e.g. song title, album title, genre, beats per minute, length, etc.). Data will be pulled from various sources online such as: 1) DJ's who publish their playlists from the events they DJ, 2) Online radio stations dedicated to playing west coast swing music, e.g. radiowcs.com 3) user created psuedo radio stations such as spotify, last.fm, etc. 4) finally music will also be pulled from sites that publish top 10, 20, 50 lists etc. Data will uniquely identified by source it came from and the time it was played (in the case of top 10 list and psuedo radio stations, the date it was added to the list will be used). I'm going to try to automate as much of the data collection as possible, and have it self maintained by scripts that i hvae already running (python scripts).
